## SUGGESTED IDENTIFICATION

U. S. Bureau of the Census. U. S. Census of Agraculture: 1954. Vol. I, Counties and State
Economic Areas, Part 3. U. S. Government Printing Office, Washongton, D. C., 1956.

For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C. or any of the Field Offices of the Department of Commerce, Price $\$ 1.50$ (paper)

## PREFACE

Volume I, Counties and State Economic Areas, is one of the three principal reports presenting the results of the 1954 Census of Agriculture. This volume, In 33 parts, presents the compilation of the information glven hy farm operators to Census enumerators in 1954.

The 1054 Census of Agriculture was taken in conformity with the Act of Congress (Title 13, United States Code) aproved August 31, 1954, which includes provisions for the mid-decade censuses of agriculture.

The collection of the data was carried out by Census enumerators directed by supervisors appointed by the Director of the Census and working under the direction of Jack B. Robertson, then Chief, Field Division. Ernest R. Underwood, then special Assistant to the Director, was responsible for the recruitment of the field staff. The plannling of the census and the compilation of the statistics were supervised by Ray Hurley, Chief, Agriculture Division, and Warder B. Jenkins, Assistant Chief. They were assisted by Hilton E. Robison, Orvin L. Wilhite, Hubert L. Collins, Benjamin J. Tepping, Lols Hutchison, Carl R. Nyman, J. Thomas Breen, Robert S. Overton, Merton V. Lindquist, Russeli V. Oliver, Charles F. Frazier, Gladys L. Eagle, Orville M. Slye, Gaylord G. Green, Harold N. Cox, and Henry A. Tucker.

Acknowledgment is made of the technical assistance and the loan of technical personnel by the United States Department of Agriculture in the planning, the enumeration, and the compilation of the 1954 Census of Agriculture.

## UNITED STATES CENSUS OF AGRICULTURE: 1954 REPORTS

Volume I.-Counties and State Economic Areas. Statistics for counties include number of farms, acreage, value, and farm operators; farlus by color and tenure of operator; facilities and equipment; use of commerclal fertilizer; farm labor; farm expenditures; livestock and livestock products; specified crops harvested; farms classified by type of farm and by economic class; and value of products sold by source.

Data for State economic areas include farms and farm characteristics by tenure of operator, by type of farm, and by economic class.
Volume 1 is published in 33 parts as follows:

| Part | State or States | Part | State or States | Part | State or States |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | New England States: |  | West North Central: <br> Minnesot |  | East South Central-Continued Alahama |
|  | New Hampshire. | 8 | Iowa. | 22 | Mississippi. |
|  | Vermont. | 10 | Missouri. |  | West South Central: |
|  | Massachusetts. | 11 | North Dakota and South | 23 | Arkansas. |
|  | Rhode Island. |  | Dakota. | 24 | Louisiana. |

| 7 | Wisconsin. | 20 | Tennessee. |  |  |

Volume II.-General Report. Statistics hy Subjects, United States Census of Agriculure, 1954. Summary data and aualyses of the data for States, for Geographic Divisions, and for the United States by suhjects as illustrated by the chapter titles listed below:

| Chapter | Title | Chapter | Title |  |
| :---: | :---: | :---: | :---: | :---: |
| I | Farms and Land in Frarms. |  |  |  |
| II | Age, Residence, Years on Farm, Work Off Farm. | VIII | Fruits and Nuts, Horticultural Specialties, | Forest |
|  | Farm Facilities, Farm Equipment. |  | Products. |  |
| IV | Farm Labor, Use of Fertilizer, Farm Expenditures, and Cash Rent. | IX | Value of Farm Products. <br> Color, Race, and Tenure of Farm Operator. |  |
| V | Size of Farm. | XI | Economic Class of Farm. |  |
| VI | Livestock and Livestock Products. | XII | Type of Farm. |  |

## Volume III.-Special Reports

Part 1.-Multiple-unit Operations. This report will be similar to Part 2 of Volume $V$ of the reports for the 1950 Census of Agriculture. it will present statistics for approximately 900 counties and State economic areas in 12 Southern States and Missouri for the number and characteristics of multiple-unit operations and farms in multiple units.

Part 2.-Ranklng Agricultural Countles. This special report will present statistics for selected items of inventory and agricultural production for the leading counties in the United States.

Part 3.-Alaska, Hawaii, Puerto Rico, Distrlct of Columbia, and U. S. Possessions. These areas were not included in the 1904 Census of Agriculture. The available current data from various Government sources will be compiled and published in this report.

Part 4.-Agriculture, 1954, a Graphic Summary. This report will present graphically some of the significant facts regarding agriculture and agricultural proluction as revealed by the 1954 Census of Agriculture.

Part 5.-Farm-mortgage Debt. This will be a cooperative study by the Agricultural Research Service of the U. S. Department of Agriculture and the Bureau of the Census. It wlll present, by States, data based on the 19.4 Census of Agriculture and a special mail survey to be conducted in January 1956, on the number of mortgaged farms, the amount of mortgage debt, and the amount of debt held by principal lending agencies.

Part 6.-Irrigation in Humid Areas. This cooperative report by the Agricultural Research Service of the U. S. Department of Agriculture and. the Bureau of the Census will present data obtained by a mail survey of operators of irrigated farms in 28 States on the source of water, method of applying water, number of pumps used, acres of crops irrigated in 1954 and 1955, the number of times each crop was irrigated, and the cost of irrigation equipment and the irrigation system.
Part 7.-Popular Report of the 1954 Census of Agriculture. This report is planned to be a general, easy-to-read publication for the general public on the status and broad characteristics of United States agriculture. it will seek to delineate such aspects of agriculture as the geographle distribution and differences by size of farm for such items as farm acreage, principal crops, and important kinds of livestock, farm facilities, farm equipment, use of fertillzer, soil conservation practices, farm tenure, and farm income.

Part 8.-Slze of Operation by Type of Farm. This will be a cooperative special repurt to be prepared in cooperation with the Agricultural Research Service of the U. S. Department of Agriculture. This report will contain data for 119 economic subregions, (essentally general type-of-farming areas) showing the general characteristics for each type of farm by economic class. It will provide data for a current analysis of the differences that exist among groups of farms of the same type. It will furnish statistical basis for a realistic examination of production of such commodities as wheat, cotton, and dairy products in connection with actual or proposed governmental policles and programs.

## INTRODUCTION

## INTRODUCTION

This report presents data relating to the agriculture of the United States based on the most recent census of agriculture taken in the fall of 1904 . The tables also include some comparative data from earller censuses.

History and legal basis.-The current census extends the number of nationwide agricultural censuses to 16 . Initially, an agricultural enumeration was taken in conjunction with the Decennial Census of Population in 1840. Congress first provided for a mid-decennial census for the year 1915; however, abnormalities created by Worid War I prevented the taking of this census. Since 1020, a national agricultural census has been taken each five years.

The 1954 Ceusus of Agriculture was unthorized by an Act of Congress approved June 18,1929 , and amended July 16, 1952. Section 16 of the Act, as amended, reads as follows: "That there shall be taken, hegiming in the month of October 1954, and ln the sume month of every tenth year thereafter, a census of agrirulture. The census herein provided for shall include each State, but shall not include the District of Columbia, Alaska, Hawail, I'uerto Rico, or such other areas or territories over which the United States exercises sovereignty or jurisdiction: Provided, however, that as to the areas excluded from such census it is directed that data available from various Government sources shall be included as an appendix to the report of such census. The Secretary of Commerce is authorized to collect such preliminary or supplementary statistics, either in advance of, or after the taking of such census, as are necessary to the initiatlon, taking, or completion thereof. The inquiries, and the number, form, and subdivisions thereof for the census provided for in this section shall be determined by the Secretary of Commerce."

The initial appropriation for map preparation, field emmeration, and a part of the office processing was obtained under this authority. Subsequently, the Congress, in a code revision alproved Angust 31, 19.4. incorporated the provisions for all censuses in a corle which may be cited as "Title 13 , United States Code."

The request for funds for fiscal year 1954 included funds for preparatory work for a complete census of agriculture to be taken in the fall of 1954 . This request was not approved by the Congress. However, a limited appropriation was made for expenses for "spot checking business, manufactures, and agrlculture in such manner as the Secretary of Commerce should decide to be most helpful and informative to said undertakings." Since one of the important uses of quinquennial agricultural census statistics is to serve as a bencbmark for the annual estimates of production and inventories prepared by the United States Department of Agriculture, the assumption was made that a "spot check" should provide rellable totals for a limited number of items by States and major producing areas. Accordingly, a sample census was conducted as a pretest of procedures in Utah and Virginia, beginning in October 1953. These surveys are more fully described in separate reports for those two States, publisbed in 1954.

Congress, in an appropriation Act approved July 2, 1954, appropriated $\$ 16,000,000$ for the expenses necessary for taking, compiling, and publishing the 1954 Census of Agriculture, as authorlzed by law. Additional funds, amounting to $\$ 5,500,000$, were appropriated in 1955 In order to complete the work on the 1954 Census.

Plan of presentation of statistics.-This report follows the same general plan of presentation as that for 1950 , the last comptete
consus of agriculture. The report is a part of Votume ] whtch comprises 33 reports. Each part of Volume I presents the data for each county and each state economic area for one or more States as well as State totals for those States for which county and State economic area data are shown. Statistics are most revealing when comparisons are avallable. Therefore, comparable data gathered in the 1950 Census of Agriculture are given for counties and for State economic areas. Comparative data for the States are given for each successive census year thesinning with 1920 . However, for some items, the data obtained in 1954 are the only ones available.

The tables provide totals for comnties for noarly all items for which information was oltalned in the 19.4 Census. Huwever, most data by economic class of farm, type of farm, and color and tenure of farm operator are presented only for State ecomonic areas. State econonic areas represent groupings of connties within a State. Outside of metropolition areas, the Ntate economic areas are, in general, the same as state tyje-of-farming areas. (A description of State economic areas is given in a Siscial Report of the 1950 Census, entitled "State Economic Areas: A Description of the Procedure Used in Making a Functional Grouping of the Counties in the United States.") A map showing the State economic areas is shown at the beginning of Clatpter $C$ of this report.

The Act of Condress excluded from the field enumeration the agriculture in Alaska, Hawaii, Puerto Rico, District of Columbia, and U. S. possessions. Available statistics, oltained from other sources, for these areas are included in l'irt 3 of Volume III.

Data for most of the items included in the 1954 Census of Arriculture, as in prior censuses, were tabulated for "minor civil divisions" or areas smaller than counties. The tern "minor civil divIsion" is applied to the primary subdivisions of the connties. These may be townships, precincts, districts, independent municipalities, unorganized territory, etc. The firures for these smaller areas are not included in any of the regular reports. However, it is possible $t o$ ohtain data for small geographic areas as heretofore, by paying the cost of cherking the data and pre paring the necessary statistical tables.

Prior to the 1954 Census, an enumeration district did not include more than one minor civil division, even though the township, precinct, or the like often did not have enough farms to provide a full workload for an enumerator. The ainı in establishing the 1954 enumeration districts was to make them large enough to keep each enumerator fully occupied in his aren for a thi ee-week, or possibiy a four-week, period. Hence, some enumeration districts included more than one minor clvil division. Such combined minor divisions were always adjacent. in enumeration district never comprised the whole of one minor civil division and a part of another nor a part of two or more minor civil divisions. A minor civil division which included too many farms for one enumerator was divided into two or more enmmeration districts.

The tabulations, as made by machines, in some cases provided totals for a single minor civil division-even thongh that required a grouping of enumeration districts-and, in other cases, they provided totals for two or more minor civil divisions comblned. In the latter instance, the small-area data will be readily àvanlable vnly for combined totals for adjoining minor civil divisions. If there is need for making a separation of the data for such combinations, thls is possible at some additlonal
cost, since each fuestionnaire contains the name of the minor civil division in which the farm headquarters was located.

Operations for 1954 Census.-The Aet providing for the 1954 Census of Agriculture states that "the inquiries, and the number, form, and subdivision thereof . . . shall be determined by the Secretary of Commerce." The staff of the Bureau of the Census prepared the questionnaire for the 1054 Census of Agriculture on the basis of experience obtained in prior censuses, on the basis of an anatysis of the sample survey for the States of Utah and Virginia fur the calendar year 1953, and on the basis of the advice of a Speeial Advisory Coumittee for the 1954 Census of Agriculture. The Advisory Committee comprised representatives of the U. S. Department of Agriculture, State Agriculturat Colleges, State Departments of Agriculture, The American Farm Economic Association, The American Statistical Association, The Association of Jand-Grant Colleges and Universities, The Agricultural Publishers Association, The Farm Equipment Institute, The American Farm Burean Federation, The National Grange, The National councit of Farmers' Cooperatives, and the Farmers' Edncational and Cooperative Union of Armerica.

The Special Advisory Committee had atso assisted in deciding the inguiries to be included on the questionnaire for the 1953 sample Census for Utah and Virginia. During the planning, State Agricultural Colleges, the U. S. Department of Agriculture, and other major users of data from the census of asricutture were asked to submit sugrested inquiries for the census. The number of inguiries recommended greatly exceeded the number that could be included in the census. The Special Advisory Cummittee and the staff of the Bureau recommended the inclusion or exclusion of these inquiries after giving consideration to the mossibitities of obtaining the information in some way other than through the census of agriculture, to the adequacy of the information that might be secured in the census, to the availability of data from other sources, and to the usefulness of the data, etc. This committee reviewed the plans and inuestiomaires for the 1953 sample enumeration and the 1904 Census of Agriculture as they were developed, and suhmitted recommendations regarding these plans and questionnaires.

The content of the 2I rexioual questiomaires (one for each State or group of adjacent States) was similar to that of the questionnaires used for the Utah and Virginia sample survess conducted in 1923 . There were variations region by region in the questionnalres to provide for differences in crops grown, in livestock production, and in cultural practices. Also, the positions of inquiries were changed in order to provide for the enumeration of some items for a limited number of farms even though other inquiries were made for all farms.

An agricultural census that collects vast quantities of reliable information requires that all employees be trained and that they adhere carefully to prescrihed procedures as welt as time schedules. For the 1954 Census of Agriculture, the Bureau devised a training program so that all employees received instructions for the respective jobs. In most instances, training sessions were held near the areas in which emplovees worked and immediately prior to the beginning of their assignments.

The 1954 enumeration required aproximately 30,000 enumerators who were supervised hy some 2,200 crew leaders. These persons were supervised by 119 field offices organized under five regional offices. From October 4 to November 8, 1954, dependiny upon the State and the area, trained enumerators began their work. Their work was to ohtain for every farm the required Information about that farm's operations, such as its crops, livestock, poultry, farm expenses, equipment and facilities, and some facts about the farm operator.

About two weeks before the reusus starting date, questionuaires were distributed to all box holders on the rural postal routes in all excent a few Southern States. The questionuaire was accompanied by a letter asking the farm operator to examine it and to answer as many of the questions as possible prior to the visit of the census enumerator. By this procedure, the Burcan expected
to expedite the work of the enumerator and to improse the quality of the information given by farmers. By reading the questionnaire, farmers knew what was wanted and could check their records in advance of the enumerator's visit.
A good census requires a complete as well as an accurate enumeration. Several techniques were used to help obtain a good census in 1954.

Instructions covering census procedures were designed in such a manner that objective criteria were supplied, and emmerators were not expected to rely on their own opinions or judgments concerning census entrles or classifications. For example, an enumerator was refuired to complete an agriculture questionnaire when specified conditions were met. He was not required to decide first what constituted a farm and then to obtain a questionnaire. Instead, a questionnaire was completed whenever minimum conditions were satisfled. Then, during central office processlng operations, a decision was made-on the basls of carefully deflned criteria-as to which questionnaires represented farms.

To help in insuring the completeness of the enumeration, enumerators were provided with a specially designed Enumerator's Record Book in which to list heads of households for the dwellings in their enumeration districts and names of the tenants or owners for places on which no one lived. The Enumerator's Record Book contained questions ahout the agricultural onerations on the place. The answers to these questions determined whether an agriculture questionnaire was required for the place and, also, whether this enumerator or an enumerator in another enumeration district was required to fill out the questionnaire.
In order to minimlze the cost of the enumeration, procedures were developed to llmit the listing of heads of households and of other places in urban areas, incorporated places, and built-up residential areas. In accordance with these procedures, enumeration districts were classified, prior to the enumeration, into three groups on the basis of the density of dwellings in relation to the number of farms according to the 1950 Censuses of Agriculture and Population.

In general, the enumeration districts with no well-defined cluster of dwellings were considered to be open-country areas and were classified as Group I Enumeration Districts. For Group I Enumeration Districts the enumerator was required to list in his Enumerator's Record Book the name of the head of each household within his district. If no one lived on a tract of land, he was requirel to list the name of the person who rented the land, worked it on shares, used it for livestock, or, if the land was not used for agricultural purposes, the name of the owner. There were approximately 15,300 Group I Enumeration Districts. These enumeration districts contained $2,778,000$ farms and $4,263,000$ dwelling units in 1950.

The rural enumeration districts in which the number of dwellings was large in relation to the number of farms were classified as Group II Enumeration Districts. In these enumeration districts the enumerator was required to list all dwelling places in his district except those on less than one acre of land in built-up residential areas, such as small incorporated or unincorporated viltages or the built-up areas adjacent to towns or cities. He was also required to determine, hy asking locally, whether there were any farms or any places of one or more acres within the built-up areas. Outside the built-up areas he was required to list the head of every househotd. There were approximately 14,800 enumeration districts classified as Group II. These enumeration districts had $8,974,000$ dwelling units and $2,420,000$ farms in 1950.

Most incorporated places and unincorporated villages with approximately 150 or more dwellings were classified as Group III Enumeration Districts. There were approximately 11,000 such enumeration districts and these contained 161,000 farms in 1950. For Group III Enumeration Districts, the enumerator was given a list of farm operators enumerated in the 1950 Census of Agriculture and was instructed to visit each place listed and tind out
whether an agriculture questionnaire was required. Any thace used for agriculture was to be listed in his Enumerator's Record Book and an agrieulture questionnaire was to be obtained. If the place was no longer used for agriculture, an explanation was to be made on the list furnished the enumerator. The enumerator was instructed to ask at each of these places whether there were any other farms or any places of 3 or more acres in the neighborhood.

A few enumeration districts that comprised an incorporated place or that were within an incorporated city were classified as Group I or Gronp, Il if the number of farms was large. Also, a few very extensive rural districts requiring considerable travel were classified in Group III when the number of farms was small.

The method preseribed for eanvassing an enumeration distriet helped to insure complete coverage. The ennmerator was instructed to proceed in a systematic manner from a logical starting point. He listed each place and each dwelling on successive lines in the Enumerator's Record Book. In addition, he was required to identify these on his enumerator's map with a cross reference to the Enumerator's Record Book. This procedure helped him to determine, by looking at his map, the extent of coverage at any given time. It also helped the erew leader in cheeking to see that coverage was complete.

Some farms were given special attention to insure their inchusion in the enumeration. Prior to the enumeration, a list known as "specified farms" was prepared from records of the 1950 Census of Agriculture. Farms having unusually large agricultural operations were included in this list. During the enumeration a careful check was made to see that each place on the specifledfarm list was accounted for. This procedure helped to insure that units which could have a signifieant effect upon the rensus data were not omitted from the enumeration. (For a detailed explanation of specified farms, sce page XII.)

Some farm units other than specified farms also received special attention to insure complete coverage. Prior to the field enumeration, lists were obtained of places known to be specializing in speeific types of agricultural production, such as garbage-feeding operations, broiler operations, large turkey farms, livestock feed lots, cranberry bogs, and citrus groves. For some of these operations, the list represented a nationwide effort to insure coverage, while for others, only some of the intensive areas of production were given this special attention. These lists were prepared, in part, with the cooperation of the Agricultural Marketing Service of the U.S. Department of Agriculture and State Agricultural Statisticians. During the enumeration, the enumerator was required to ohtain a questionnaire for each place or otherwise satisfactorily account for each place on the list of specified farms or on other special lists.

Some areas of the Higld Plains required special consideration since the usual enumeration procedure was complicated by the prevalence of nonresident operators and widely scattered tracts operated as one farm. In these areas a special mapping form was used to insure complete eoverage. Land was checked off on the mapping form by section, township, and range as it was enumerated. This check map, designed for plotting sections within a township, was subdivided into 16 parts of 40 acres each. Enumerators were required to indicate on this form all land in farms that they enumerated. Cross references were made between the questionnaire and the map. The enumerator identified land for a given questionnaire on bis cheek map by writing the number identifying the questionnaire in each corresponding 40 aere square of the check map. The check map helped the enumerator and, subsequently, the crew leader and other personnel reviewing the enumerator's work to determine whether the coverage of the enumeration district was complete. This procedure was used in all of North Dakota and South Dakota and selected counties in Colorado, Kansas, Montana, Nebraska, New Mexico, and Oklahoma. In general, the areas for which such maps were used corresponded with the major wheat-producing sections with low rainfall.

A special supplementary guestiommaire was used in approxinately 900 counties in the South. This questionnaire, designated the Landlord-Tenant Questionnaire, aided in the enumeration of cropper and other tenant farms which were parts of larger landholdings. This additional form was eompleted when two or more agriculture questiomaires were needed for a landholding. Since it calted for the name and agricultural operations of each tenant on the tandholding, the procedure enabled an enmmerator to determine that all operations were reported completely and only once. 'The Enumerator's Record Book, used in these selected southern counties, differed from that used elsewhere. The southern version helped the enumerator to identify the landholdings for which this supplementary laudlord-tenant form was required.

Crew leaders, in supervising enumerators, began reviewing questionnaires, maps, and other forms and checking the enumerator's work for completeness of coverage and quality almost as soon as the enumeration was started. The crew leader and his enumerators were required to make the records of their respective areas as accurate and as complete as possible.

While assembling records, the field processing oflices also made certain ehecks. Although these offices performed no detailed editing of questionnaires, some steps were taken to detect enumeration districts in which the enumerator's work was not fully satisfactors, especially in regard to coverage. The 26 processing offices were given a form, for each county, which contained data from the 1050 Census for the number of farms and land in farms. Where possihle, this form gave the 1950 comparative data for the enumeration districts or for the minor civil divisions comprising each county. For most counties, it was possible to furnish, at the county level, an additional check figure. This figure was the acreage of one of the following crons: wheat, corn, cotton, tobaceo, or rice. In most instances, these eheck figures represented measured acreages (before harvest) as determined by the Commodity Stabilization Service of the U.S. Department of Agriculture. By checking totals for the enmmeration districts with these check data, it was possible to determinc and remedy obvious underenumeration hefore records were released from field processing offices. The 1054 totals for the county, together with the check data, were sent to the Washington office for review and approval before the enumeration was considered acceptable.

After the canvass of an enumeration district was completed, the supervising crew leader collected the questionnaires and other records from the enumeratur and sent them to the processing office for his area. The processing offices made some checks on the enumeration in each enumeration district. In this checking, emphasis was placed upon preparation of payrolls, completeness of coverage, and the correct application of the sampling procedure.

The final operations for the agricultural census were handled in central offices. The Washington office was the focal point of these activities; but, for the first time, some of the agricultural census operations were decentralized into areas outside of Washington. Census operations offices were established at Detroit, Michigan and Pittsburg, Kansas.

Upon their release from field processing offices, records were transferred to the two Census operations offices. Although there were exceptions, in general, records from the Northern and Northeastern States were sent to the Detroit office and those from Southern and Western States were sent to Pittsburg, Kansas. At these offices, questionnaires were edited and coded and the information was entered on punch cards for tabulation.

In the operations offices, the checking, editing, and coding were berformed for individual agriculture questionnaires. The ehecking consisted of seeing (1) that the questionnaires were completely filled out; (2) that the acreage of individual crops harvested was in reasonable agremment with the acreage of eropland harvested when 100 or more acres of cropland harvested were
rejorted; (3) that the acres of land classiffed according to use acconnted for the entire farm acreage for farms having 200 acres or more; (4) that the total of the acreage for the various uses of corn, sorghum, soybeans, cowpeas, and peanuts was in reasonable agreement with the total acreage reported for all purposes for each of these crops; (5) that the age and sex breakdown for cattle, hogs, and sheep added to approximately the total number of such tuimals of all ages ; and (6) that all entries for related items were reasonably cousistent. Editing consisted of the identification and withdrawai of questionnaires filled for places not qualifying as farms; the selection of questionnaires with entries of unusually large size for review by the technical staff; the selection of groups of questionnaires with common reporting errors in an individual emmeration district for referral to technical personnel for review; and the correction of obvious inconsistencies, such as reporting in an incorrect unit, or reporting ln an improper place on the questionnaire. Coding consisted of entering code numbers for crops for which there were no separate inquiries on the questionnaire, for color and tenure of operator, and for irrigation; and, for a sample of farms, of entering codes for economic class of farm and tyje of farm. Entries determined by the technical staff to be in error were corrected on the basls of relationships exlsting on nearby farms or, if the entries were large, on the basis of correspondence with the farm operator. In case of information missing for a group of questions, estimates were prepared on the basls of adjacent questionnaires for farms with similar operations and, in some cases, on the basis of information obfained by mail from farm operators. When estimates were made, letters were mailed to the farm operators to verify the information and, if the estimates were not in reasonable agreement with the information contained in the replies, the entries were corrected before tbe tabulations were made.

After punch cards were prepared, the punch cards, together with records containing the corresponding basic data, were forwarded to the Washington office for tabulation. Once on punch cards, the data were sorted, listed, or otherwise handled mechanically to facilitate making final checks and to obtain totals. One of the initial and primary steps in the machine handing of the punch cards was to separate those cards which lacked necessary information, those on which the punched data were inconsistent or impossible, and those on which the relationships were possible but the data were of such magnitude that a further review of the individual questionnaires was warranted. These cards containing questionable data or lacking data were examined, checked to the agriculture questionnaires, and corrected, if necessary, before the tabulations were made.

Finally, tabulations were examined from the standpoint of over-all reasonableness and consistency. This examination required the judgment of specialists and was the primary responsibility of senior Census staff members. However, qualified State personnel of the Agricultural Marketing Service, U. S. Department of Agriculture, assisted in examining the data, especially those for crops and livestock, evaluating the results, and calling attention to the situations for which further checking was necessary.

## DEFINITIONS AND EXPLANATIONS

Specifled farms.-"Specified farms" refers to the larger farms that were selected for special handling during the enumeration and during the provessing of the agriculture fuestionnaires. Although the criterla for thelr selection have varled since this technique was first used in the 1945 Census of Agriculture, the basic purposes for employing this technique tave not changed. One purpose for using a list of specifled farms was to help to get a complete enumeration.

The criteria for selecting specified farms were kept as simple as possible in orler to facilitate the work of enmmeration. In most States, only one item was considered in classifying farms as "specified." The following are the criteria nsed for the 1954 Censns:

Criteria
Area
Land in the farm $-1,000$ acres or more

All States
Cropland harvested :
200 acres or more
500 acres or more
Florida

Irrigated cropland harvested:
200 acres or more_....--- Arizona, California, Louisiana
Cattle and calves:
100 or more.
Alabama, Mississippi, N. W. Missouri

200 or more Louislana
Milk cows :
100 or more
Arizona, California, Florida
Chickens sold :
70,000 or more
Delaware, Maryland, West Virginia
Occasionally, a farm which did not meet any of the criteria chosen, but which bulked large in respect to some other farm characteristics, had to be treated as a specified farm to reduce its effect on the results insed on a sample of farms.

In terms of total agricultural production, the operators of specified farms account for a significant part of the total production. For example, in the 1950 Census, 71,328 farms (then designated "large" farms) were handled on a special basis. Although this number was only 1.3 percent of all farms, these "large" farms accounted for 17.3 percent of the value of all farm products sold and 33.1 percent of all land in farms. The criteria used for establishing the group of speclfied farms for special bandling in the 1954 Census resulted in more than twice as many farms ( 147,000 in the 1054 Census as compared with 72,000 in 1950 ) being given special attention.

## General Farm Information

Date of enumeration.-The enumeration of the 1954 Census of Agriculture was made during the latter part of 1954 . In the 1950 Census the starting date for the enumeration was April 1. The 1954 Census beginning dates were varied by areas or States, ranging from October 4 to November 8 . In general, the varied starting dates were based unon (1) selecting dates late enough for the enumeration to follow the harvesting of the bulk of important crops, (2) setting the dates early enough to avoid undesirable weather and travel conditions during the enumeration, and (3) arranging for the enumeration to be substantially completed prior to customary dates when farm operators move from one farm to another. The average date of enumeration for the 1954 Census for each county is given in County Table 7, and the percentage of farms enumerated by various dates for the State and the date or dates for the starting of the enumeration are given in State Table 11.

Information for inventory items is based on the situation as of the actual day of enumeration. Data on acreage and quantity of crops harvested are for the crop year 1954. Data on sates of crops relate to crops harvested in the year 1954 regardless of when sold; data on sales of livestock products relate to the production and sales during the ralendar year 1954 . Since the period to be includct was not yet completed for some items at the time of enumeration, special emphasis was placed upon including accurate estimates for such items for the remainder of the period. For example, the question relating to dalry products stated, "Be sure to include dairy products which gou will sell before January 1 , 1955."

A farm.-For the 1954 and the 1950 Censuses of Agriculture, places of 3 or more acres were counted as farms if the anmual value of agricultural products, exclusive of home-garden products, amounted to $\$ 150$ or more. The agricultural products could have been either for home use or for sale. Places of less than 3 acres were counted as farms only if the annual value of sales of agricultural products amounted to $\$ 150$ or more. Places for which the value of agricultural products for 1954 was less than these minima because of crop failure or other unusual conditions, and
places operated at the time of the census for the first time were counted as farms if normally they could be expected to produce these minimum quantities of agrieultural products.

All the land under the control of one person or partnership was included as one farm. Control may have been througlı ownership, or through lease, rental, or cropping arrangement.

For the 1954 Census, enumerators were instructed to obtain an agriculture questionnaire for all places that the operator considered a farm and for all places having during 1904 (1) any hogs, eattle, sheep, or goats; (2) any crops such as corn, oats, hay, or tobacco ; (3) 20 or more chickens, turkeys, and geese; (4) 20 or more fruit trees, grapevines, and planted nut trees; or (5) any vegetables, berries, or nursery or greenhouse produets grown for sale. Thus, agriculture questionnaires were filled tor more places than those qualifying as farms.

The determination as to which reports were to be included in the tabulations as farms was made during the central office processing of questionnaires.

For the 1945 and earlier censuses of agriculture, the definition of a farm was somewhat more inclusive. Census enmmerators were provided with the definition of a farm and were instructed to fill reports only for those places whicb met the eriteria. From 1925 to 1945 , farms for census purposes included places of 3 or more aeres on which there were agricultural operations, and places of less than 3 acres with agricultural products for home use or for sale with a value of $\$ 250$ or more. For places of 3 or more aeres, no minlmum quantity of agricultural production was required for purposes of enumeration; for places of under 3 acres all the agricultural products valued at $\$ 250$ or more may have been for home use and not for sale. The only reports excluded from the tabulations were those taken in error and those with very limited agricultural production, such as only a small bome garden, a few fruit trees, a very small flock of chickens, etc. In 1945 , reports for places of 3 acres or more with limited agricultural operations were retained if there were 3 or more acres of eropland and pasture, or if the value of products in 1944 amounted to $\$ 150$ or more when there was less than 3 acres of cropland and pasture.

Because of changes in price level, the $\$ 250$ limit for value of products for farms under 3 aeres resulted in the inclusion of varying numbers of farms in the several censuses prior to 1950 .

The change in the definition of a farm in 1950 , and continued In 1954, resulted in a decrease in the number of farms as compared with earlier censuses, especially in the number of farms of 3 or more aeres in size. Places of 3 or more acres with a value of agricultural products of less than $\$ 150$ were not counted as farms in the 1954 and 1950 Censuses. In some cases, these places would bave been counted as farms if the criteria used in 1954 and 1950 had been the same as those used in previous censuses. The change in the definition of a farm had no appreciable effect on the totals for livestock or crops, for the places affected hy this change ordinarily accounted for less than 1 percent of the total for a county or State.

There are two figures published for the number of farms for each county in 1954. One is an actual count of all farms enumerated, and the other is an estimate based upon the number of sample farms multiplied by 5 , plus the number of specified farms. In almost every county, the actual number of farms and the estimated number of farms differ. Because of sampling variabilits, the selection of the sample of farms seldom resulted in the inclusion of exactly 20 percent of the non-specified farms. The number of farms in the sample in a county was accepted if this number was within predetermined limits. The counties that were not acceptable were adjusted to bring the number of sample farms within the predetermined limits.

Therefore, the aetual number of farms in the sample is more or less than 20 percent in most instances. Similarly, the estimated total for information obtained for the sample of farms may be slightly more or slightly less than the totals which would have
been obtained if the data had been tabulated for all farms. Therefore, occasionalls the estimated number of farms reporting for some items may be greater than the total number of farms enumerated. The estimated number of farms is shown in the tables so that estimates based on the farms in the sample can be related to the estimated number of farms rather than to the actual number of farms.

Enumeration of land located in more than one county.-Land in an individual farm mas be located in two or more counties. In such ease, the entire farm was enumerated in only one county. $1 f^{\prime}$ the farm operator livel on the farm, the farm was enumerated in the county in which the farm onerator lived. If the farm operator did not live on the farm, the figures for the farm were included in the county in which the farm headquarters was located. If there was any question as to the location of the headquarters of the farm, the farm was included in the county in which most of the land was located.
Farm operator.-A "farm operator" is a person who operates a farm, either performing the labor himself or directly supervising it. He may be an owner, a hired manager, or a tenant, renter, or sharecropper. If he rents land to others or has land cropped for him by others, he is listed as the operator of only that land which he retains. In the case of a partnership, only one partner was included as the operator. The number of farm operators is considered the same as the number of farms.

Farms reporting or operators reporting.-Figures for farms reporting or operators reporting, based on a tabulation of all farms, represent the number of farms, or farm operators, for which the specified item was reported. For example, if there were 1,022 farms in a county and only 1,465 had chickens over 4 months old on hand, the number of farms reporting chickens would be 1,465 . The difference between the total number of farms and the number of farms reporting an item represents the number of farms not having that item, provided the inquiry was answered completely for all farms.

For some of the items, such as the residence of the operator, for which reports were to have been obtained for all farms, figures are given for the number of farms not reporting. The number of farms, or operators, not reporting indicates the extent of the incompleteness of the reporting for the item.

Figures for farms reporting or operators reporting, hased on a tabulation for only a sample of farms, represent the total estimated from the sample, not the actual number of farms or operators reporting.

Land owned, rented, and managed.--The land to be included in each farm was determined by asking the number of acres owned, the aeres rented from others or worked on shares for others, and the acres rented to others or worked on shares by others. The acres in the farm were obtained by adding the acres owned and acres rented from others or worked on shares for others, and subtracting the acres rented to others or worked on shares by others. In case of a managed farm, the person in charge was asked the total acreage managed for his employer. The acreage that was rented to others or cropped by others was subtracted from the total managed acreage.

For 1954 and 1950, the figures for land owned, land rented from others, and land managed for others include land rented to others by farm operators. In earlier censuses, the enumerator was instructed to include all land rented from others and to exclude all land rented to others. Thus, he recorded only that portion of the acreage owned and the acreage rented from others which was retained by the farm operator. For prior censuses, the land included in each farm was essentially the same as that included for the 1954 and 1950 Censuses.

Land owned.-Land owned includes all land that the operator or his wife, or both, hold under title, purchase contract, homestead law, or as one of the heirs, or as a trustee of an undivided estate.

Land rented from others.-Land rented from others includes land worked on shares for others, and land used rent free,
as well as all tand rented or leased under other arrangements. Grazing land used under government permit was not included.

Land rented to others.-Many farm operators rent land to others. For the most part, the land rented to others represents agricuttural land but it atso inctudes tracts rented for residential or other purposes. When land is leased, rented, or cropped on shares, the tenant or cropper is considered the farm operator even though his landlord may exercise supervision over his operations. The landlord is considered as operating only that portion of the land not assigned to tenants or croppers.
Land area.-The approximate total land area reported for 1954 for States and counties is, in generat, the same as that reported for the 1950,1945 , and 1940 Censuses. Changes since 1940 represent changes in boundary, actual changes in land area due to the construction of reservoirs, etc. The figures for 1940 represent a complete remeasurement of the United States and, therefore, may differ from the figures shown for earlier censuses.

Land in farms.-The acreage designated "land in farms" includes considerable areas of land not actuatty under cultivation and some land not used for pasture or grazing. All woodtand and wasteland owned by farm operators, or included in tracts rented from others, is inctuded as land in farms unless such tand was held for other than agricultural purposes, or unless the acreage of such land held by a farm operator was unusually large. If a place had 1,000 or more acres of land not being used for agricultural purposes and less than 10 percent of the total acreage in the ptace was used for agriculturat purposes, the nonagricuttural land in excess of the number of acres used for agricultural purposes was excluded from the farm area. In applying this rute, land used for crons, for pasture, or grazing, and land rented to others were considered to be land for agriculturat purposes. On the other hand, land was defined as nonagricultural when it was woodtand not pastured, or in house and barn lots, roads, lanes, ditches, or wasteland. The procedure used in 1950 for excluding unusualty large acreages of nonagricuttural land differed slightly from the one used for the current census. In 1950, adjustments were made in places of 1,000 acres or more (5,000 acres or more in the 17 Western States) if less than 10 percent of the total acreage was used for agriculturat purposes. Except for open range and grazing land used under government permit, att grazing land was to be included as tand in farms. Land used rent free was to be inctuded as tand rented from others. Grazing lands operated by grazing associations were to be reported in the name of the manager in charge. All land in Indian reservations used for growing crops or grazing livestock was to be inctuded. Land in Indian reservations not reported by individual Indians or not rented to mon-Indians was to the reported in the name of the cooperative group using the land. Thus, in some instances the entire Indian reservation was reported as one farm.

Land in farms according to use.-Land in farms was classified according to the use made of it in 1954. The classes of land are mutualty exclusive, i. e., each acre of land was inctuded only once even though it may have had more than one use during the year.

The classes are as follows:
Cropland harvested.-This inctudes tand from which crops were harvested; land from which hay (inctuding wild hay) was cut ; and land in small fruits, orchards, vineyards, nurseries, and greenhouses. Land from which two or more crops were reported as harvested was to be counted only once.

The enumerator was instructed to check the figure for cropland harvested for each farm by adding the acreages of the indivilual crops reported and subtracting the acres of land from which two crops were harvested. This procedure was repeated during the central office editing process for farms wilh 100 or more acres of cropiand harvested.

If the harvested cropland was used for other purposes, elther before or after the harvest of a crop, the enumerator was specifically instructed to report the acreage only under cropland harvested.

Cropland used only for pasture.-In the 1954 and 1950 Censuses, the enumerator's instructions stated that rotation pasture and all other cropland that was used only for pasture were to be included under this class. No further definition of cropland pastured was given the farm operator or enumerator. Permanent open pasture may, therefore, have been included under this Item or under "other pasture," depending on whether the enumerator or farm operator considered it as cropland.

The figures for 1945 and earlier censuses are not entirely comparable with those for the tast two censuses. For 1945 , the figures inctude only cropland used solely for pasture in 1944 that had been plowed within the preceding seven years. The figures for this item, for the Censuses of 1940 . 1935, and 1925, are more nearty comparable with those for the Censuses of 1954 and 1950, as they include tand pastured that could have been plowed and used for crops without additional clearing, draining, or irrigating.

Cropland not harvested and not pastured.-This item includes idle cropland, land in soit-improvement crops onty, tand on which all crops faited, land seeded to crops for harvest after. 1954, and cuttivated summer fallow.

In the Western States, this class was subdivided to show separately the acres of cultivated summer fallow. In these States, the acreage not in cultivated summer fallow represents largely crop failure. There are very few counties in the Western States in which there is a large acreage of idle cropland or in which the growing of soil-improvement crops is an important use of the land.

In the States other than the Western States, this general class was subdivided to show separately the acres of idte cropland (not used for crops or for pasture in 1954). In these States, the incidence of crop failure is usually low. It was expected that the acreage figure that exctuded idle land would reflect the acreage in soil-improvenment crops. However, the 1954 crop year was one of low rainfatl in many Eastern and Southern States and, therefore, in these areas the acreage of cropland not harvested and not pastured lncludes more land on which all crops failed than would usually be the case.

Cultivated summer fallow.-This item includes cropland that was plowed and cultivated but left unseeded for several months to control weeds and conserve moisture. No land from which crops were harvested in 1954 was to he Included under this item.
Woodland pastured.-This includes atl woodland that was used for pasture or grazing. The questionnaire contained the following instruction: "Include as woodtand all wood lots and timber tracts and cutover land with young trees which have or will have value as wood or timber." No definition of woodland was given in 1990 to either farm operators or Census enumerators excent an instruction to enumerators not to include brush pasture as woomland. Some of the changes in woodland acreages from one census to another may merely represent differences in interpretation of the meaning of woodland.

Woodland not pastured.-This includes all woodland that was not used for pasture or grazing. Unusually large tracts of timberland reported as woodhand not pastured were exchuded from the tabulations of land in farms when it was evident that such land was held primarity for nonagricultural purposes. The definition for woodiand, as stated above, was used also for ennmerating woodtand not pastured.

Other pasture (not cropland and not woodland).-This inctudes rough and brush land pastured and any other land pastured that the respondent did not consider as either woodland or cropland. The figures for 1954 and 1950 are comparable but for 1945 all nonwoodland pasture not powed within the preceding 7 years was included. For the 1940 Census and earlier years, the figures are more nearly comparable with those for 1954 and 1950, except that the item may be somewhat less inclusive since land that could have heen plowed and used for crops without additional clearing, draining, or irrigating was classified as plowable pasture (shown as cropland used onty for pasture j ( f tables).

Improved pasture.-This item includes land in "other pasture" on which one or more of the following practices had treen used: Liming, fertitizing, seediug to grasses or legumes, irrigating, draining, or controlling weeds and brush. Tle question on improved pasture was included in 1954 for the first tline.
other land (house lots, roads, wasteland, etc.).-This item includes house lots, barn lots, lanes, roads, ditches, and wasteland. It inctudes all land that does not belong under any of the other fand-use chasses.

In addition to the complete classification of tand in farms according to use, the tables also present data for three summary classlfications as follows:

Cropland, total.-This includes cropland harvested, cropland used only for pasture, and cropland not harvested and not pastured.
Land pastured, total-This includes cropland used only for pasture, woodland pastured, and other pasture (not cropland and not woodland).

Woodland, total.-This includes woodland pastured and woodland not pastured.
Valne of land and bnildings.- The value to be reported was the approximate amount for which the land and the buildings on it would setl. This item was obtained for only a sample of the farms; however, the value was not reported for all the farms comprising the sample.

Many problems, not encountered in enumerating most agricultural items, are involved in obtaining farm real-estate values. Most enumerated items require the respondent to make a statement based upon fact. It mas be the number and value of farm animals sold alive during the year or the number of lambs under 1 sear old on the place. In either case, only information as to activities during a specified period, or the situation as of a stated tlme, is required. This information is based upon actual transactions or existing conditions. But the estimation of the value of land and buitdings is based targely upon opinion. In the event a farm had been recently purchased, answers could be based upon that experience. But many farms have not changed hands for many years, nor are thes currently for sale. In such cases, farm operators may have no clear basis for estimating the value. In making an intelligent estimate, a respondent needs, first, to estlmate the prevailing market value in the community. Secondly, he most in some way add to or subtract from this base to allow for his farm's special characteristics. In many cases, a farm operator who would not sell his place under any circumstances may be inclined to give a "market ralue" that is unreasonably high. Some operators who had purchased their real estate during periods of relatirely low prices mas give an estimate that is unduly influenced by that experience. Furthermore, the extent of variation known to exist in real-estate values makes it difficult to establish checking procedures that will disclose inaccurate estimates.

Only average vatues of land and buildings per farm and per acre are presented in this report. A totat value of the land and buildings for States, geographic divisions, and the United States, will be presented in Volume II.

Age of operator.-Farm operators were classified by age into six age groups. The average age of farm operators was calculated by dividing the total of ages of all farm operators reporting age by the number of farm operators reporting.

Residence of farm operator.-Farm operators were classified by residence on the basis of whether or not they lived on the farm operated. Some of those not living on the farm operated lived on other farms. When a farm operator rented land from others or worked land on shares for others and had the use of a dwelling as part of the rentat arrangement, the enumerator was instructed to consider the dwelling a part of the farm operated. The dwelling assigned may have been on a tract other than that assigned for crops. Since some farm operators live on their farms only a portion of the year, comparability of the figures for various censuses may be affected to some extent by the date of the enumeration. In a few cases the enumerator failed to indicate the residence of the farm operator. Differences between the total number of farms and the number of farm operators by residence represent underreporting of this item.

Years on present farm (year began operation of present farm).The data on years on present farm and year began operation of present farm were secured on the basis of the inquirs, "When did you begin to operate this place?

> (Month)
(Year)
time of year that farmers move is indicated by the month they hegan to operate their farms, as shown by a breakdown of the data for those farm operators who began to operate their present farms in the calendar years 1954 and 1983 . The tabulation of sears on present farm at each census is based on the catendar year the operator began operating his farm. Because of differences in the date for varions censuses, the figures are not fully comparable from one census to another.
Off-farm work and other income.-Many farm operators receive a part of their lncome from sources other than the sale of farm products from their farms. The 1954 Agriculture Questionnaire included severat lnquiries relating to work off the farm and nonfarm income. These inquiries called for the number of days worked off the farm by the farm operator; whether other members of the operator's family worked off the farm; and whether the farm operator received income from other sources, such as sale of products from land rented out, cash rent, hoarders, old age assistance, pensions, veterans' allowances, unemployment compensation, interest, dividends, profits from nonfarm business, and belp from other members of the operator's famity. Another inquiry asked whether the income of the operator and his family from off-farm work and other sources was greater than the total value of ath agricultural products sold from the farm in 1954. Off-farm work was to include work at nonfarm jobs, businesses, or professions, whether performed on the farm premises or elsewhere; also work on someone else's farm for pay or wages. Exchange work was not to be included.
The purposes of these four inquiries were (1) to ohtain information in regard to the extent that farm operators performed off-farm work and the relation of other nonfarm income to the value of farm products sold and (2) to provide a basis for the classification of farms by economic class (see Farms by economic class, page XXII). The intent of the inquiry in regard to whether or not a member of the family had a nonfarm job, and the inquiry regarding income of the farm operator from other nonfarm sources, was to obtain more accurate replies to the inquiry regarding the relationship of the income from off-farm work and other sources to the total value of all agricultural products sold.
Specified facilities and equipment.-Inquirles were made in 1954 for a sample of farms to determine the presence or absence of selected items on each place such as (1) telephone, (2) piped running water, (3) electricity, (4) television set, (5) home freezer, (6) electric pig brooder, (7) milking machine, and (8) power feed grinder. Such facilities or equipment were to be counted even though temporarily out of order. Piped running water was defined as water piped from a pressure system or by gravity flow from a natural or artificial source. The enumerator's instructions stated that pig brooders were to include those heated by an electric heating element, by an infra-red or heat bulb, or by ordinary electric buths. They could be homemade.

The number of selected types of other farm equipment was also obtained for a sample of farms. The selected kinds of farm equipment to be reported were (1) grain combines (for harvesting and threshing grains or seeds in one operation) ; (2) corn pickers; (3) pick-up halers (stationary ones not to be reported) ; (4) field forage harvesters (for field chopping of sitage and forage crops) ; (5) motortrucks; (6) wheel tractors (other than garden) ; (7) garden tractors; (8) crawler tractors (tracklaying, caterpillar) ; (9) automobiles; and (10) artificial ponds, reservoirs, and earth tanks.
Wheel tractors were to include homemade tractors but were not to include implements having built-in power units such as self-propelled combines, powered buck rakes, etc. "Pick-up" and truck-trailer combinations were to be reported as motortrucks. Schoot huses were not to be reported, and jeeps and station wagons were to be included as motortrucks or automobiles, depending on whether used for hauling farm products or supplies, or as passenger vehicles.
Classification of farms by class of work power.-Farms were grouped by class of work power on the basis of whether horses,
mules, or tractors (wheel or crawler, but not garden) were reported. This classification does not present a complete picture of the work power used on all farms. For some farms, all the work power may be furnished by the landiord; and for some farms, all the work power may be hired. Thus, farms hiring all of the work power from others and those tharing it furnished are shown as having no work power, unless the work animals or tractors were kept on the tenant-operated tract.

Since the number of tractors was obtained for onty a sample of farms, the number of farins by ctass of work power represents an estimate.

Farm labor.-The farm-labor inquiries for 1954, made on a sample basis, called for the number of persons doing farm work or chores on the place during a specified calendar week. Since starting dates of the 1954 enumeration varled by areas or States, the calendar week to which the farm-tabor inquiries related varied also. The calendar week was September 26-October 2 or October 24-30. States with the September 26-October 2 calendar week were : Arizona, California, Colorado, Connecticut, Florida, Idaho, Kansas, Kentucky, Louisiana, Maine, Massachusetts, Michigan, Minnesota, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Dakota, Oklahoma, Oregon, Pennsylvania, Rhode Island. South Dakota, Tennessee, Texas, Utah, Vernont, Washington, Wisconsin, and Wyoming. States with the October $24-30$ catendar week were: Alabama, Arkansas, Detaware, Georgia, Illinois, Indiana, Iowa, Maryland, Mississippi, Missouri, North Carolina, Ohio, South Carolina, Virginia, and West Virginia. Farm work was to include any work, chores, or planning necessary to the operation of the farm or ranch business. Housework, contract construction work, and labor involved when equipment was hired (custom work) were not to be included.

The farm labor information was obtained in three parts: (1) Operators working, (2) unpaid members of the operator's family working, and (3) hired persons working. Operators were considered as working if they worked 1 or more hours; unpaid members of the operator's family, if they worked 15 or more hours; and hired persons, if they worked any time during the calenclar week specified. Instructions contained no specifications regarding age of the persons working.

Data shown for earlier censuses are not fully comparable with those for 19:4, primarity because of differences in the period to which the data relate. The data for 1954 were purposely related to a period of peak farm employment. During 19 ano the labor inquiries were retated to the calendar week preceding the actual enumeration. Although starting dates were identical in all States (April 1, 1950), several weeks were required to complele the field work. Therefore, the calendar week preceding the enumeration was not the same for atl farms. For the 1945 and 1935 Censuses, the number of farm workers related to the first week in January. The data for 1940 related to the last week in March. In 1945, 1040, and 1935, only persons working the equivalent of two or more days during the specifled week were to he inchuded. In 1945 and 1940, only workers 14 years old and over were to be included. In 1935, as in 1954 and 1950, there was no specification regarding the age of the farm workers. No instructions were issued to include farm chores as farm work in 1940 and 1985 Censuses.

In censuses prior to 1954 , farm-labor data were not atways satisfactorily reported when the specified week for reporting the number of persons employed did not immediately precede the week during which the actual enumeration was made. When the week, for which a report for the number of persons emptoyed was required, was several weeks before the week of enumeration, the farm operator or the enumerator often reported the highest number of persons employed during the year. When it was obvious that the data were not correctiy reported, adjustments were made to make the data reflect more nearly the situation during the specified weck. IBecause of demand for the data, the information on number of persons working on farms, for the 1954 Census, relates to a specified week. In some cases, this specifled week was
several weeks before the week of actual ennmeration. However, few adjustments were made in the data for 1954 even though there were indications that there was incorrect reporting or that the report may have referred to a week other than the week specified.

Regular and seasonal workers.-Hired persons working on the farm during the specified week were classed as "regular" workers if the period of actual or expected employment was 150 days or more during the year, and as "seasonal" workers if the period of actual or expected employment was less than 150 days. If the period of expected employment was not reported, the period of employment was estimated for the individual farm after taking into account such items as the basis of payment, wage rate, expenditures for labor in 1954, and the type and other characteristics of the farm.

Hired workers by basis of payment.-Hired persons were also classified according to the basis of payment. The questionnaire called for the numbers of hired workers paid on a monthty basis, on a weekly basls, on a daily basis, on an hourly basis, and on a piecework basis. If the basis of payment was not reported for any of the hired workers, the missing information was supplied.

Wage rate and hours worked.-The rate of pay (except for workers on a piecework basis) and the hours that workers were expected to work to earn this pay (except for workers on hourly basis or on piecework basis) were asked for each class of worker. For 1954, the data include estimates of hours worked and wage rates for questionnaires incomplete for either of these items. Estimates were based upon relationships existing on nearby farms of similar size and type. Data for 1950 for hours worked and wage rates were restricted to farms reporting both wage rates and hours worked.
Fertilizer and lime.-The 1954 questionnaires contain inquiries on the tonnage and cost of fertilizer and liming material and the acreage on which they were used during the calendar year 1954. Fertilizer and lime used on the place were to be included regardless of whether the landowner, tenant, or both paid for them. Fertilizer was to include only commercial fertilizer or fertilizing material. No specific mention was made of basic slag. It was thought that this byproduct of steel production would be considered as a fertilizing naterial. Barnyard manure, straw, refuse materials, and soil conditioners were to be excluded. Lime or liming material was to include ground limestone, hydrated and burnt lime, marl, oyster shells, etc. No mention was made of gypsum but this product was excluded in the processing when the entries for such were detected. Lime used for sprays or sanitation purposes was to be omitted.

Acres on which purchased materials were used were to be reported for both lime and fertilizer. In case fertilizer was applied to the same crop more than once in 1954 , instructions were to report acres of land onty once but to report the total tonnage used. The acres fertitized and tons applied were obtained separately for selected crops. The selected crops varied by reglons. This arrangement made it possible to obtain data for crops most commonly fertilized in the region.

For some counties, the tonnage of lime shown in the table may be less than the tonnage reported for the Agricultural Conservation Program. In some cases, the difference may arise becanse of sampting error and in other cases, it may be the result of underreporting by farm operators. Many of the differences disappear when the data are presented for larger areas.
In the South, some landtords, who conducted some farming operations themselves, reported for their operations fertilizer and lime paid for wholly or in part by them for use on their tenantoperated land. The tenants may atso have reported the fertillzer and lime. During the editing procedure such reports, when detected, were adjusted to prevent duplication in the reports for fertilizer and lime by landlords and their tenants.

Specified farm expenditures.-The 1954 Census obtained data for selected farm expense items in addition to those for fertilizer and time. The expenditures were to include the total specified expenditures for the place whether made by landlord, tenant, or both.

Expenditures for machine hire were to include any labor included in the cost of such machine hire. Machine hire refers to custom machine work such as tractor hire, threshlng, combining, silo filling, baling, giming, plowing, and spraylng. If part of the farm products was given as pay for machine hire, the value of the products traded for this servlce was to be included in the amount of expenditures reported. The cost of trucking, frelght, and express was not to be included.

Expenditures for hired labor were to lnclude only cash payments. Expenditures for housework, custom work, and contract construction work were not to be included.
Expenditures for feed were to include the expenditures for pasture, salt, condiments, conceutrates, and mineral supplements, as well as those for grain, hay, and mill feeds. Expenditures for grinding and mixing feeds were also to be included. Payments made by a tenant to his landlord for feed grown on the land rented by the tenant were not to be included.
Expenditures for gasoline and other petroleum fuel and oil were to include only those used for the farm business. Petroleum products used for the farmer's automobile for pleasure or used exclusively in the farm home for lieating, cooking, and lighting were not to be included.

Farm-mortgage debt.-Data on farm-mortgage debt will be contained in a speciai report (Part 5 of Volume III) to be issued in 1956. This report wiil contain data only for States and larger geographic areas.

## Crops

Crops harvested.-The agriculture questionnaire was organized to make possible the iisting of acreage and quantity harvested for each crop. To facilitate the enumerator's work, speclic crop questions were varied according to areas (usually each area comprised a State or a group of States). Regionaiizing questionnaires made it possible to devote special attention to the more important crops for a given area and also to use the unit of measure that was in most common use in the area.

In most instances, the harvested acreage that was reported for individual crops represents the area harvested for the 1054 crop year. An exception was made for land in fruit orchards, vineyards, and planted nut trees; in this case the acreage represents that in both bearing and nonbearing trees and vines as of the date of enumeration (usually October or November 1954). The acreage harvested for various crops is often less than the acreage planted.

With three exceptions, citrus fruits, olives, and avocados, figures for quantity harvested represent the amount actually harvested during the 1954 crop zear. Citrus fruit production was to be reported for the 1953-1954 marketing season (from the bloom of 1953). Olive and avocado production for California related to the quantity harvested from the 1953 bloom (an instruction to enumerators referred to the marketing season which began October 1, 1953). In Florida, the avocado production period, according to the Enumerator's Instruction Book, was to include the quantity harvested from the 1953 bloom (the harvesting season extending from July 1, 1953, to June 30, 1954).
The unit of measure used for reporting the quantity harvested for some crops has varied, not only from State to State, but from census to census, to permit reporting in units of measure currently in use. In the State and county tables, figures on quantity harvested for each crop are shown in the unit of measure appearing on the 1954 Agriculture Questionnaire. When required, data for earlier years were converted into units of measure differing from those which were used in the published reports for those years.

Corn.-The inquiries regarding corn acreage and quantity harvested were not the same in all States. In areas where farmers frequently use units of measure such as baskets, barrels, etc., the questionnaire permitted the reporting of quantity harvested in bushels or in an alternative unit of measure. When alternative
units of measure other than bushels (shelled basis) were reported on the questionnaire, the quantity was converted into bushels prior to tabulation. As in former censuses, farmers in certain areas had a tendency to report the quantlty of corn harvested in terms of baskets of ear corn, barrels, or some unit other than bushels of corn on a slielled basis. Such reports, when detected, were corrected to represent the equivalent bushels of 70 prounds of ear corn or 56 pounds of shelled corn.

Annual legumes.-Acres and quantity harvested for the most important uses of soybeans, cowpeas, and peanuts, as well as the total acreage grown for all purposes, were obtained for areas where these crops are grown extensively. The total acreage grown for all purposes includes some acreage not harvested as the acreage plowed under for green manure was included. In certaln States, separate figures were obtained for the acres grown alone and the acres grown with other crops. For the 1954 Census, enumerators were instructed to report acres and value of sales for cowpeas harvested for green peas with vegetables harvested for sale. For 1949, the total acreage of vegetables harvested for sale, shown in State and country tables, includes the acres of cowpeas harvested for green peas for the following States: Alabama, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, and Texas. However, for 1949 the number of farms reporting and the value of vegetables harvested for sale do not include farms reporting or the value of cowpeas harvested for green peas.

Hay crops.-The tables contain data regarding the total acres of land from which hay was cut. Sorghum, sosbean, cowpea, and peanut hays were excluded from this total as separate questions were provided in those States where these crops are important. The figures for total land from which hay was cut for 1954 were obtained by adding the acres of the various hay crops, including grass silage, for each county. The comparable figures for the $\mathbf{1 9 5 0}$ Census were obtained by an inguiry of the farm operator. Alfalfa hay includes any production which was dehydrated. The tonnage of alfalfa hay for dehydration (as well as that for other hays but not for grass silage) is given on a dry-weight basis.

Enumerators and farmers were instructed to report the total quantity of hay harvested from all cuttings, but to report only once the acres of land from which more than one cutting was made. For 1954, alfalfa hay included alfalfa and alfalfa mixtures. Likewise, clover and timothy hay included clover and timothy and mistures of clover and grasses. For 1950, the agriculture questionnaire contained instructions to report mixed hay under the kind of hay that made up the largest part of the mixture. The differences in the instructions for reporting mixed hays affect the comparability of the data for the 1954 and prior censuses. The kinds of hay to be reported under "Other hay" varied from State to State, and can be determined for a specific State by referring to the copy of the questionnaire in the Appendix.

Clover seed, alfalfa, grass and other field seed crops.-The 1954 questionnaire contained separate inquiries for a number of the field seed crops and provided a question on "other field seed crops' for the purpose of obtaining information for all minor field seed crojs harvested.

Irish potatoes and sweetpotatoes.--The 1954 Census inquiry for both Irish and swect potatoes called for acres harvested and the quantity harvested. If less than 20 lushels (or 10 bags in specifled States) of Irish potatoes or if less than 20 bushels of sweetpotatoes were harvested, the enumerator was instructed to report the quautity harvested, but not the area harvested. This method of reporting was used in order to facilitate the enumeration of potatoes grown on small plots for home use. The procedure and inquiries for both Irish potatoes and sweetpotatoes were essentially the same for 1950 . Data for censuses prior to 1950 are not entirely comparable with those for 1950 and 1954. Earlier censuses did not eliminate the acres of the smali plot-home-use production of Irish potatoes and sweetpotatues. There-
fore, especially in counties or States where the production of potatoes is largely for home use, the data on acres for 1954 and 1950 are not fully comparable with those for earlier censuses.

Berries and other small fruits.-The questionnaire called for acreage and quantity harvested in 1954 for sale. Nonbearing areas and areas from which berries or fruits were not harvested for sale were not to be reported. Separate lnquirles were carried on the questionnaire for such berries as strawberries, blackberries, and raspherries (tame) In States where production of these crops was important commercially.

Tree fruits, nuts, and grapes.-For 1064, the number of trees or vines and the quantity harvested were not enumerated If there was a total of tess than 20 fruit or nut trees and graperines on the farm. For censuses prior to 1954, enunerators were instructed to report the number of fruit or nut trees and grapevines and the quantlty harvested, regardless of how many trees or grapevlnes were on the farm. Because of this change in instructions, the data for 1954 are not fully comparable with those for prior censuses. In commercial fruit-producing counties, the change in instructions may have affected considerably the number of farms reporting, but had little effect on the number of trees or the quantity harvested. On the other liand, in counties where most of the fruit and nut trees and grapevines are in small plantings, largely for producing fruit or nuts for consumption on the farm, the change in instructions may have resulted in a reduction not only in the number of farms reporting, but also in the number of fruit and nut trees and grapevines, as well as in the quantity harvested.

For 1954, the acreage $\ln$ fruit orchards, groves, vineyards, and planted nut trees was not enumerated If there were less than 20 fruit or nut trees and grapevines on the farm. For the 1950 Census, enumerators were instructed not to report the area in fruit orchards, groves, vineyards, and planted nut trees if the area was less than one-half acre. For censuses prior to 1950 , enumerators were lnstructed to report the area in all orchards, vineyards, and planted nut trees regardless of size of the area. However, frequently enumerators did not report the area for small fruit plantings and home orchards. In areas where small fruit and nut plantings or home orchards comprise a considerable part of the total fruit and nut acreage, considerable change may ive indicated from census to census in the acreage of land in fruit trees, planted nut trees, and grapevines hecause of differences in enumeration procedures or in the enumerators application of the instructions.

In the regional questionnaire for Arizona and Califoruia, the acreage in each individual fruit and nut crop was secured.

The acreage in fruit and planted nut trees and grapevines does not usually include the acreage of wild pecans that were not planted. For Maine, the acreage in cropland harvested includes the acreage from which wild blueberries were harvested.

The unit of measure used for the quantity of fruits, grapes, and nuts harvested varied from State to State. Tables in this report show the quantity harvested in the unit of measure appearing on the 1054 Agriculture Questionnaire.

Nursery and greenhouse products.-The agriculture questionmaire inciuded three inquiries relating to horticultural-speciatty crops. One called for acres and value of sales in 1954 of nursery products (trees, shrubs, vines, ornamentals, etc.). Another asked for the area grown undier glass; area grown in the open; and value of sales of cut flowers, potted plants, florist greens, and bedding plants. The third called for area grown under glass or in house; area grown in the open; and value of sales of vegetables grown under glass, flower seeds, vegetable seeds, vegetable plants, buJbs, and mushrooms. The inquiries in 1954 were essentially the same as those used in the 1950 Census.

Value of crops harvested and value of crops sold.-The totat value of crops harvested represcuts the value of all crops harvested during the crop year 1954. It includes the value of the part of the crop consmmed on the farm and the value of the part of the
crop used for seed on the farm, as well as the value of the part of the crop that was sold.

Farmers were not asked to report the value of crops harvested. The values were calculated in the cent ral office by multlplying the quantity harvested for each crop by the average prlce at which the crop was sold In the State. These State average prices were obtalned cooperatively by the Agricultural Marketing Service, United States Department of Agrlculture, and the Bureau of the Census. The prices are based on reports provided by a sample of farmers and dealers. However, average prices were not calculated for vegetables harvested for sale, nursery and greenhouse products, and forest products. In the absence of the value of quantities harvested for these products, the value of sales whlch was obtalned in the enumeration was used In calculating the totai value of crops harvested.

State Table 16 gives data for the value of that part of each crop sold. The questionnaire did not call for reports of sales (quantity sold or the value of sales) for all crops. Estimates of the quantities sold were made ln the central office for those crops for which the quantity sold was not enumerated. (For the procedure used in estimating the quantity of each crop sold, see Value of farm products sold, page XXiII.) For each crop, the quantity sold was multiplied by the average State price in order to obtain the value of the quantlity sold. Enumerators and farmers were instructed to report the landlord's share as sold unless it was used for feed or seed on the place where it was produced.

In 1950 , the value of crols sold was obtained by inquiry of each farm operator during the enumeration.

Forest products.-The forest products data obtained by the Census relate only to those products cut on farms. Commerclal logging, timber operations, and forest products cut on places not counted as farms are excluded. Therefore, the data published do not show the total forestry output and income for a county or State.

The questlons inciuded in the 1954 questionnalre were essentially the same as those for 1950 . However, a change was made in the enumeration of the sales of standing timber. In 1950, a special question asked for "sales from standing tlmber," while in 1954 , instructions were to report any standing timber cut as sawlogs and veneer logs.

## Irrigation

Irrigated land was deflned as land to which water was applied by artificial means for agricultural purposes. Water applied by subirrigation was included as well as that applied to the surface. Irrigated land included land irrlgated by a sprinkler system. Land flooded during high-water periods was to be considered as irrigated land only if water was purposely applied for agricultural purposes by means of dams, canals, or other works. Regulation of the "water table" by drainage works was not to be included as irrigation.

There were two groups of irrigation inquiries used for the 1954 Census. One group was used in the 17 Western States (Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Utah, Washington, and Wyoming) and In Arkansas, Florlda, and Louisiana. The other group was used in the remaining 28 States. In the 17 Western States and Arkansas, Florida, and Louisiana, the agriculture questionnaire contained several inquirles regarding irrigation. These inquiries related to the area of irrigated land from which crops were harrested and the names of the crops for which the entire acreage harvested was irrigated in 1954. In all of these States except Arkansas and Louisiana, the area of irrigated pasture was also obtained. In the remalning States, the agriculture questionnaire called for only the total acres irrlgated $\ln$ 1954. This acreage may have been used for harvested crops, solt-inprofement crops, or for pasture.

The inquiries relating to irrigation for the 1954 Census were essentially the same as those for the 1950 Census. However, in

1950, irrigated land from which no crop was harvested was included as irrigated land, while snch acreage was not obtalned in 1054.

Considerable data are published regarding irrigation in the 17 Western States and Arakansas, Florida, and Louisiana. The following definltions apply to these States:
Irrigated farms.-These are farms reporting land irrigated. Data on land in irrigated farms and on land in Irrigated farms according to use include the entlre acreage of land in these farms, whether irrigated or not.
Land irrigated.-This relates only to that part of the land in irrigated farms to which water was applied. However, for Arkansas and Lonislana the total for irrigated land does not include land used solely for pasture or grazing. For the 17 Western States and for Arkansas, Florida, and Louisiana, this total does not include irrlgated cropland that was not harvested and not pastured.

Irrigated land in farms according to use.-This classification provides data on the use of irrigated land in farms and includes that part of the cropland harvested that was irrigated as well as that portion of the land pastured to which water was applled.
Farms with all harvested crops irrigated.-These are all "irrigated farms" on which all crops harvested were grown on irrigated land.
Irrigated crops harvested.-The data for irrigated crops harvested include (1) the acreage of crops harvested on irrigated farms on which all harvested crops were irrigated and (2) the acreage of those crops which were wholly irrigated on farms where a part of, or all of, other harvested crops were not irrigated. Thus, the reported acreage in irrigated crops may not include the total acreage of each harvested crop grown on irrigated land, but the exclusions are minor. However, in the case of vegetables harvested for sale and orchard fruits and nuts, the data for farms reporting number of trees, value of sales, etc., relate only to those crops harvested on farms on which all crops were irrigated.

## Land-Use and Conservation Practices

Land in cover crops turned under for green manure.-The data for this item represent land on which a cover crop was turned under in 1954 and another crop was planted for harvest after 1954. Such acreages were to be reported even though the succeeding crop may later have failed. This inquiry was not made in Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, Nortb Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, Wyoming, and the western part of Texas.
Stripcropping.-The data for stripcropping relates to the area of row crops or close-seeded crops that were grown in strips across the path of prevailing wiuds to prevent or reduce the blowing of topsoil. This question was included only in Colorado, Idaho, Kansas, Montana, Nebraska, Nevada. New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, Wyoming, and the western part of Texas.
Cropland used for grain or row crops farmed on the contour.This is the area for all grain and row crops that were planted around the slope to maintain comparatively level rows instead of being planted in straight rows running up and down the slope.

## Livestock and Poultry

The 1954 questionnaire called for an inventory of or for some phase of production for all the important kinds of farm animals and poultry. Respondents were asked for the numbers on hand on the day of enumeration. Livestock were to be enumerated on the place on which they were located, regardless of ownership. Livestock grazing in national forests, grazing districts, or on open range at the time of enumeration were to be reported for the farm or ranch to which they belonged.

The time of the year at which livestock and poultry were enumerated influences greatly the resulting data. Therefore, the date of the enumeration needs to be considered when comparing

1054 totals with those for corresponding items for the 1950 or prior censuses. The 1950 data represented a spring inventory (April 1, 1950), while the current census provided a fall inventory. The 1954 enumeration came at a time of large scale movement of flocks and herds from one range to another, from ranch to feeder, and from farm or ranch to market.

The censuses of agriculture beginuing with 1920 and continuing through 1950 were taken as of either Aprit 1 or January 1. The censuses taken in the sears ending in " 0 " were taken as of April 1, white the censuses taken in the years ending in " 5 " were taken as of January 1. An enumeration made in April results in a count that differs considerably from a count made in January. In most areas a large number of animals are born between January and April. On the other hand, a considerable number of older animals are sold or die during the 3 -month period, January to April. In the range states, sheep and cattle are moved, with the change in season and grazing condition, from one locality, or country, to another. This movement may affect the comparability of data for counties and, in some cases, for States. The comparability of the data for the number of livestock and poultry has also been affected by changes in age groups and questionnaire inquiries from census to census. State Table 12 presents a description of the various age and sex groups of livestock and poultry for each census from 1920 to 1954.

Milk cows; cows milked; milk sold.-Data on number of cows milked and milk production relate to the day preceding the enumeration.
Questionnaires in 25 States, chiefiy western and midwestern, provided three alternative units of measure for enumerators and respondents to report whole milk sales: (1) Pounds of milk, (2) pounds of butterfat, and (3) gallons of milk. In the other States, sales of whole milk on the basis of butterfat content were considered relatively unimportant and, therefore, the unit of measure (pounds of butterfat) was omitted from the questionnaire. However, for publication by States, the reports for whole milk sold were converted into a unit of measure common to the particular State. Pounds of butterfat were converted into gallons or pounds of whole milk on the basis of the average butterfat content of whole milk, as shown by data fnrnished by the Agricultural Marketing Service of the United States Department of Agriculture.

The tables for economic areas contain figures on total milk sold. These figures represent the total equivalent of milk and pounds of butterfat in cream sold in terms of whole milk.

Total sales of all dairy products for 1954 are not entirely comparable with those for 1949. The value of sales for whole milk and cream was included in both the 1954 and 1945 Censuses. In 1950, the value of the sales of butter, buttermilk, and cheese was obtained; the value of these products was not included in 1954.

Sows and gilts farrowing.-The 1954 questionnaire asked for spring litters by an inquiry on the number of sows and gilts farrowing between December 1, 1953, and June 1, 1954, and for fall litters by an inqniry on the number of sows and gilts farrowing since June 1, but before December 1, 1954. The inquiry relating to sows farrowing or expected to farrow during the fall was included in the census for the first time in 1954. The 1954 data for spring farrowings (sows and gilts farrowing between December 1, 1953, and June 1, 1954) are comparable with those for 1950. Since no data were obtained in 1950 for fall farrowing, only the 1904 data for farrowing after June 1 are given. For a number of counties, the ratio of sows farrowing to the number of hogs and pigs on hand, plus those sold, may be low because hogs or pigs were shipped into the county for feeding. Adjustments in the number of sows farrowing were made hoth for spring and fall litters when there was substantial evidence that the number of sows farrowing was not reported. The adjustments were made largely in counties outside the major hog-producing areas.
Sheep and lambs and wool.-Questionnaires for all States, except Florida, Georgia, and South Carolina, contained inquiries
regarding sheep and lambs. In Florida, Georgia, and South Carolina, the enumerator was instructed to report the number of sheep and lambs in the remarks section. However, no data on the number of sheep and lambs or on wool production were compiled for these 3 States for 1954.

Goats and rohalr.-In Loulsiana, New Mexlco, Oklahoma, Oreson, Texas, Washington, and selected countles in Missourl, special questions were provided for reporting goats and mohalr. These questions called for the number of all goats, Angora goats, and other goats, separately, and for the number of goats clipped and pounds of mohalr cllpped in 1054.

Bees and honey.--Provision was not made for reporting bees or honey for the 1954 Census.

Falue of livestock on farms.-The values for 1954 shown in State Table 13 were secured by multlplying the number of each class of livestock or poultry on hand by the State average price. These prices were ohtalned cooperatively by the Agricultural Marketing Servlce, Unlted States Department of Agriculture, and the Bureau of the Census.
Livestock prodncts.-The inquirles regarding livestock produc. tlon and sales relate to the calendar year 1954, and those for sales of livestock products reiate to the products produced in 1954.
sale of llve anlmals. -The 1954 questionnaire caited for the number and value of sales of animals sold alive from the place durlng 1954. The questions nsed were slmilar to those used ln the 1050 Census. The difference in the time of enumeration for the two censuses may have affected the comparability of the data. Since the 1954 Census was a fali enumeration, an additlonal problem was invoived $\ln$ getting information on anlmals sold alive. It was necessary not only to ask the respondent for sales he had made during 1954 prior to the date of the ennmeration, but also for an estimate of sales he would make during the remainder of 1954. Some respondents may not have reported sales to be made after the enumeration but before December 31, 1954. No data are avallable to Indlcate the extent of under-reporting of sales of llvestock and poultry.

Poultry and poultry products.-For the 1054 Census, chicken sales were subdivided into sales of (1) broilers and (2) other chlckeus. This Is the first census in which broilers were enumerated separately. The enumeration of broilers presented problems because of the varied contractual arrangements under which brollers are produced. The agriculture questlonnalre contained the following lnstruction: "Report all brollers sold from this piace lncluding those ralsed for others under contract." In a number of cases, young chickens were reported as broilers sold. Entrles of less than 1,000 chlckens or broilers sold, for individual farms, were tabulated as other chickens sold.

## SAMpling

Sampling was used for the 1954 Census of Agriculture in two ways. Flrst, information on fertilizer and lime, farm expendtures, farm lahor, off-farm work, facilltles and equipment on the place, farm value, and mortgage deht, was enumerated for only a sample of farms. (The information in Sections VIII through XIII of the questionnalre was obtalned only for the farms in the sample. See Appendix for copy of the questionnaire.) Second, some tabulations were prepared on the basis of a sample of farms. As a result, a greater volume of data conld be published than if the reports for all farms had been used for every tabulation. Most of the data shown in this report by State economic areas are estimates prepared on the basis of the tabulation of data for the sample of farnis. These tabulatlons are for the same sample of farms for which data were collected on a sample hasls during the enumeratlon.

Description of the sample for the 1054 Census.-TThe sample used for the 1054 Census of Agrlculture consisted of speclfed farms (see page XII for a deserlption of speclfied farms) and one-fifth
of the remainlng farms. Thus, the sample included slightly more than 20 percent of all farms.

The actual selection of farms in the sample was made by census enumerators as part of the enumeration procedure. The enumerator llsted the head of each household on a single line of the Enumerator's Record Book, and determined whether an agriculture questionnaire was to be obtained. If he was required to fill a questionnaire, he entered the "number of acres in this place" in accordance with question 11 of the agriculture questlonnalre. On the basls of the number of acres in this place, the enumerator recorded a check mark in one of five squares that provlded for the recording of each farm in one of five size-offarm groups. All the squeres for farms with 1,000 or more acres were lightly shaded and a random fifth of the squares for each of the other four slze groups was also lightly shaded. (See Appendix for an example of a page of the Enumerator's Record Book.) If the respondent was listed on a line for which the shaded square corresponded to the size of his farm, his farm was included in the sample. The agriculture questionnaire contained one or more inquirles at the beginning of Section VIIIthe first section contalnlng inquiries to be asked for only a sample of farms (See copy of questionnalre in Appendix)-for the guldance of the enumerator as to whether the questlonnaire was for a farm to be included $\ln$ the sample and whether the farm qualifled as a specified farm.

Adjustment of the sample.-An adjustment in the 20 percent part of the sample was made by a process essentially equivalent to stratlfying the farms ln the sample by size, for the purpose of (1) improving the rellability of the estimates from the sample on an economic area level, and (2) for the purpose of reducling the effects of posslble biases lntroduced because some census enumerators did not follow perfectly the method devised for selectlng the farms in the sample. In order to adjust the sample for each State economic area, counts were obtained of all farms and of sample farms for each of ten size-of-farm groups based on "acres in this place." The ten size-of-farm groups were as follows: Under 10 acres. $10-29$ acres, $30-49$ acres, $50-69$ acres, 70-99 acres, 100-139 acres, 140-179 acres, 180-259 acres, 260-499 acres, and 500-999 acres. In determining the extent of the adjustment, the difference between the number of farms in the sample and the total number of farms divided hy five was obtained for each size group. The actual adjustment for the size group was made by either eliminating or duplicating, on a random basis, farms In those counties of the State economic area where the greatest over- or under-representation existed.

Method of estlmation.-Data which are based on the sample of farms were expanded to represent figures for all farms. The expanded figure for an item was obtained by multlplying by five the tabulated total for that item for the farms in the 20 percent part of the sample and adding the total for the specified farms.

Rellabllity of estlmates based on the sample.-The estimates based on the tabulation of data for a sample of farms are subject to sampling errors. When data hased on a sample of farms are shown in the same tahle with data for all farms, the data based on a sample are shown in italics. In case all the data in a table are estimates based on a sample, a headnote for the table Indlcates that the data are estimates based on a sample of farms. Approximate measures of the sumpling reliability of estimates are given In State Tables 18 and 19 for farms reporting and for item totals. These measures indicate the general level of sampling reliability of the estimates, but do not include adequate allowances for sources of error other than sampling variation as, for example, errors in originat data furnished by farmers. Sources of error other than sampling may be relatively more important than sampling variation, especlally for totals for a State.

In general, the measures of samplling reliablity presented are conservative in that they tend to overestimate the variations in sample extimates, because (1) the predicted limits of error do net always take fully into consideration that complete data were

Labukated for all specified farms and (2) the maximum figures lntended to serve for all economic areas were used. Consequentty, there is a tendencr to overestimate the variations in the sample, especially for groups with large mmbers of farms or for groups for which the totals for specitied farms represent a high percentage of the item totals.

Data in State Tables 18 and 19 are given to assist in determining the gencral level of sampling reliability of estimated totals. In State Table 19 a list of the items is given and the level of sampling reliability as shown in State Table 18 is indicated. By referring to State Table 18 in the column for the level of sampling rellahility designated in State Table 19 , the sampling error according to the number of farms reporting may he obtained. For farms reporting, the indicated level of sampling is level 1. State Table 18 shows percentage himits such that the chances are about 68 in 100 that the difference between the estimates based on the sample and the figure that would have been obtained from a tabulation for all farms would be approximately within the limit specified. However, the chances are 90 in 100 that the difference would be less than two and one-half times the percentage given m the table.

The data in State Table 18 indicate that when the number of farms reporting specified items is small, the item totals are subject to relatively large sampling errors. Nevertheless, the considerable detail for every classification for each item is presented to insure maximum usefumess for appraising estimates for any combination of items that may be desired.

Percentage figures and averagos derived from the tables will generally have greater reliability than the estimated totals; also, signiffeant patterns of relationships may sometimes be observed even though the individual data are subject to relatively large sampling errors.
The data representing estimates based on a sample for the 1950 Census were ohtained in essentially the same way as in 1904 and the same State Tables 18 and 19 mar be used to estimate the sampling errors for the 1950 data.
Differences in data presented by counties and by State economic areas.-In many cases, data presented by State economic areas were estimated on the hasis of tabulations for a sample of farms, while most of the data presented by counties were obtained by the tabulation of data for all farms in the comity. However, data for the number of farms classified by trlue of farm and economic class of farm, and for the use of fertilizer and lime, farm expenditures, farm labor, farm facilities, farm equipment, and value of land and bulldings were estimated for each county on the basis of the tabulation of data for a sample of farms in each county. The same sample of farms was also used for the tabulation of data for these items for State economic areas and for the State. In some cases, the totals presented for these items for State economic areas or for the State will differ sligbtly, but not significantly, from the totals obtained by adding figures for counties in the State economic area or the State. As a matter of economy, small adjustments were not made in the tabulations when the difference was not large enough to affect the usefulness or reliability of the data.

## Classification of Farms

The classifications of farms by color and temure of operator, economic class of farm, and type of farm were made on the basis of visual inspection of each questionnaire during the office processing.

The classification for color and tenure of operator was made for all farms, while the classifications by economic class and by trpe of farm were made for only a sample of farms. The classification of farms by size was made for all farms by means of electric tabulating equipment.
Farms by size.-Farms were classified by size according to the total land area of each farm. The same classification was used for all States.

In analyzing size-of-farm statistics, consideration should be given to the definition of a farm for census purposes. Census farms are essentially operating units, not ownershlp tracts. If a landlord has croppers or other tenants, the land assigned each cropper or tenant is a separate farm even though the landlord may operate the entire holding essentially as one farm in respect to supervision, equipment, rotation practices, purchase of supplies, or sale of products.

In some parts of the South a special questionnaire, the Land-lord-Tenant Questionnaire, was used to obtain statistics for such multiple units. The statistics for multiple units will be published in Volume III, Part 1.

Farms by tenure of operator.-Farm operators are classified according to the temure under which they hold their land on the basis of the replites to the inguiries on total land owned, total land rented from others, total land managed for others, and land rented to others. The hasis of classification lis temure is, in general, the same for the 1954 as for the 1950 Census. In 19\%), for an operator who owned land and rented land from others, there was no way to determine whether land rented to others represented land owned by the operator or land rented by the operator from others; therefore, such an operator was classified as a part owner. In 1945 and earlier, full owners, part owners, and tenants were classified on the basis of the land retained. Under this earlier classification a part owner who sublets to others all the land he rents from others would have been classified as a full owner; a part owner who rents to others all the land he owns would have been classified as a tenant. In 1004, the acreage of owned land that was rented to others was obtained for the tirst time. Thus, it was possible to chassify a farm operator who owned land and rented land from others as a full owner, part owner, or tenant according to the ownership or rental of the land he retained.

Full owners own land but do not retain any land rented from others.

## Part owners own land and rent land from others.

Managers operate farms for others and are paid a wage or salary for their services. Persons acting merely as caretakers or hired as laborers are not classified as managers. If a farm operator managed land for others and also operated land on his own account, the land operated on his own account was considered as one farm and the land managed for others as a second farm. If a farm operator managed land for two or more employers all the land managed was considered one farm.
Tenants rent from others or work on shares for others all the land they operate. Tenants are further classitied on the basis of their rental arrangement as follows:

Cash tenants pay cash as rent, such as $\$ 10$ an acre or $\$ 1,000$ for the use of the farm.

Share-cash tenants pay a part of the rent in cash and a part as a share of the crops or of the livestock or livestock products.

Share tenants pay a share of either the crops or livestock or livestock products, or a share of both.

Crop-share tenants pay onls a share of the crops.
Croppers are crof-share tenants whose landords furnish all work power. The landlords either furnish all the work animals or furnish tractor power in lien of work animals. Croppers usually work under the close supervision of the landowners, or their agents, or another farm operator, and the land assigned them is often merely a part of a larger enterprise operated as a single unit.
Livestock-share tenants pay a share of the livestock or livestock products. They may or may not also pay a share of the crops.
Other tenants include those who pay a fixed quantity of any product ; those who pay taxes, ketp up the land and buildings. or keep the landlord in exchange for the use of the land ; those who have the use of the land rent free; and others who conld not be included in one of the other snecified subclasses.
Unspecified tenants include those tenants for whom the rental arrangement was not reborted.
For earlier censuses, the definition for each subclass of tenant is essentially the same as for 19.54 . However, in 1945 the emmerator was asked to determine the subelass of tenants, while in 1954, 1950,1940 , and earlier censuses the classification vas made during the processing of the questionnalres on the basis of the answer to the inquiries on the questionnaires. The
procedure for 1945 may have affected the comparability of the data, particularly those for cash tenants and sharecash tenants.
Farms by color or race of operator.-Farm operators are classified by color as "white" and "nonwhite." Nonwhite includes Negroes, Iudians, Chinese, Japanese, and all other nonwhite races.

Farms by economic class.-A classification of farms by economic class was made for the purpose of segregating groups of farms that are somewhat alike in their characteristics and size of operation. This classification was made in order to present an accurate description of the farms in each class and in order to provide basic data for an analysis of the organization of agriculture. Only the farms in the sample were classified by economle class. The totals given in the tables represent estimates for all farms based on tabulations of the data for the farms included in the sample.

The classification of farms hy economic class was made on the basis of three factors; namely, total ralue of all farm products sold, number of days the farm operator worked off the farm, and the relationship of the income received from nonfarm sources ly the operator and nembers of his family to the value of all farm products sold. Farms operated by institutions, experiment stations, grazing associations, and community projects were classilied as abnormal, regardless of any of the three factors.

For the purpose of determining the code for economic class and type of farm, it was necessary to obtain the total value of farm products sold as well as the value of some individual products sold.

The total value of farm products sold was obtalned hy adding the reported or estimated values for all products sold from the farm. The value of livestock, livestock products except wool and mohair, vegetables, nursery and greenhouse products, and forest products was obtained by the enumerator from the farm operator for each farm. The enumerator also obtained from the farm operator the quantity sold for corn, sorghums, small grains, hays, and small fruits. The value of sales for these crops was obtained hy multiplying the quantity sold by State average prices.

The quantity sold was estimated for all other farm products. The entire quantity produced for wool, mohair, cotton, tobacco, sugar heets for sugar, sugarcane for sugar, broomcorn, hops, and mint for oil was estimated as sold. If the estimated value of the quantity sold for any other crop was $\$ 100$ or more, the entire quantity harvested was estimated as sold. To obtain the value of each product sold, the quantity sold was multiplied by State average prices.

In making the classification of farms by economic class, farms were grouped into two major groups, namely, commercial farms and other farms. In general, all farms with a value of sales of farm products amounting to $\$ 1,200$ or more were classified as commercial. Farms with a value of sales of $\$ 250$ to $\$ 1,199$ were classified as commercial only if the farm operator worked off the farm less than 100 days or if the income of the farm operator and members of his family received from nonfarm sources was less than the total value of all farm products sold. The remaining farms with gross income of $\$ 250-\$ 1,199$ and farms with a value of sales of all farm products of less than $\$ 250$, as well as farms operated by institutions, experiment stations, grazing associations and community projects were classified as "other farms."

Commercial farms were divided into six groups on the basis of the total value of all farm products sold, as follows :
 or provided the income the farm operator and mem less than 100 days, recelved from nonfarm sourcea was less than the value of all farm
products sold.

Other farms have been grouped into three classes as follows:
Part-time farms.-Farms with a value of sales of farm products of $\$ 250$ to $\$ 1,199$ were classified as part time if the farm operator reported (a) 100 or more days of work off the farm in 1954, or (b) the nonfarm income received by him and members of his family was greater than the value of farm products sold.

Residential farms.-Residential farms include all farms except ahnormal farms with a total value of sales of farm products of less than $\$ 250$. Some of these represent farms on which the operator worked off the farm more than 100 days in 1954. Some represent farms on which the ineome from nonfarm sources was greater tban the value of sales of agricultural products. Others represent subsistence and marginal farms of various kinds. Some farms are included here which, if the classification were based on farm production for more than 1 year, might have qualified as commercial farms.

Abnormal farms.-Insufar as it was possible to identify them, abnermal farms inclute public and private institutional farms, comnunity enterprises, experiment-station farms, grazing associations, etc.
Farms by type.-The classification of farms by type was made on the basis of the relatiouship of the value of sales from a particular sonrce or sources to the total value of all farm products sold from the farm. In sume cases, the type of farm was determined on the basis of the sale of an individual farm product, such as cotton, or on the basis of closely related products, such as dairy products. In other cases, the type was determined on the basis of sales of a broader group of products such as corn, sorghums, all small grains, field peas, field beans, cowpeas, and soybeans. Part-time, residential, and abnormal farms were not classified by lype. In order to be classified as a particular type, sales or anticipated sales of a product or a group of products had to represent 50 percent or more of the total value of products sold.

Only the farms in the sample were classified by type. The data given in this report by type of farnı relate only to commercial farms.

The types of farms for which data are shown, together with the product or group of products on which the classification is based, are:

|  | Product or group of products amounting <br> to 50 percent or more of the value of all |
| :---: | :---: |
| Type of farm | farm products sold |

$\qquad$ Corn, sorghum, small grains, field peas, field beans, cowpeas, and soybeans.
Other field-crop--.-.-.--
leanuts, Irish potatoes, sweetpotatoes, tobaceo, sugarcane, sugar beets for sugar, and other miscellaneous crops.
Vegetable........-.-......... Vegetables.
Fruit-and-nut_-.....-. Berries and other small fruits, and tree fruits, grapes, and nuts.
Dairy_-_-_-_-_-_-_-_ Milk and other dairy products. The eriterion of 50 percent of the total sales was modified in the case of dairy farms. A farm for which the value of sales of dairy products represented less than 50 percent of the total value of farm products sold was classified as a dairy farm if-
(a) Milk and other dairy products accounted for 30 percent or more of the total value of products sold, and
(b) Milk cows represented 50 percent or more of all cows, and
(c) Sales of dairy products, together with the sales of cattle and calves, amounted to 50 percent or more of the total value of farm products sold.
Poultry Chickens, eggs, turkeys, and other poultry products.
Livestock farms other Cattle, calves, hogs, sheep, goats, wool, than dairy and poultry.
and mohair, provided the farm did not qualify as a dairy farm.

Type of farm
General
iscellaneons.

Product or group of products amonnting to 50 percent or more of the value of all farm products sold-Continued
Farms were classified as general when the value of products from one source or group of sources did not represent as much as 50 percent of the total value of all farm products sold. Separate figures are given for three kinds of general farms:
(a) I'rimarily crop.
(b) Primarily livestock.
(c) Crop and livestock.

Primarily crop farms are those for which the sate of one of the following crops or groups of crops-vegetables, fruits and muts, cotton, cash grains, or other field crops-did not amount to 50 percent or more of the value of all farm products sold, but for which the value of sales for all these grouns of crops represented 70 percent or more of the value of all farmi products sold.
Primarily livestock farms are those which could not qualify as dairy farms, poultry farms, or livestock farms other than dairy and poultry, but on which the sale of livestock and poultry and livestock and poultry products amounted to 70 percent or more of the value of all farm products sold.
General crop and llvestock farms are those which could not be classified as either crop farms or livestock farms but on which the sale of all crons amounted to at least 30 percent but less than $\mathbf{7 0}$ percent of the total value of all farm products sold.
This group of farms inclurles those that had 50 percent or more of the total value of products accounted for hy sale of horticultural products, or sale of horses, or sale of forest products.
The classification of farms by type of farm for the $195+$ Census was made on essentially the same basis as that for the 1050 Census. In 1950, miscellaneous farms included those that had 50 percent or more of the total value of products accounted for by the sale of fur animals, or the sale of bees and honey, in addition to the items included in the 1954 classification.

Valne of farm prodncts sold.-Data on the value of farm products sold were obtained for 1954 by either of two methods. First. the values of livestock sold alive, poultry, poultry products, vegetables harvested for sale, nursery and greenhouse products, forest products, and all llvestock products, except wool and mohair, were obtained during the enumeration by asking the farm operator the value of sales.

Second, the values of all other agricultural products sold were estimated for each county. During the enumeration, the quantiiy sold was obtained for each farm, for corn for grain, sorghums for grain or forage, small grains, hays, and for all small frults and berries. For all other crops, the quantity sold was estimated for each county. For the purpose of computing value of farm products sold, it was assumed that the entire quantity harvested, or reported, was sold for the following crops:

## Strawberries

Blackberries
Dewberries
Raspberries
Blueberries
Boysenberries
Loganberries
Youngberries
Cranberries
Currants
Gooseberries
Elderberries Other berries Apples
Peaches (except in selected States where the proportion of the crop culled was considerable)

Clingstone peaches (except in a few States where the proportion of the crop culled was considerable)
Pears
Cherries
Plums and prunes
Plums (except in selected States where the proportion of the crop culled was considerable)
Prunes (except in selected States where the proportion of the crop culled was considerable)
Apricots
Avocados (except in selected States where the proportion
of the crop culled was considerable)
Figs
Mangoes
Ne'tarines
Olives
Grapes
Banamas
Dates
Guavas
Japanese persimmons
Jujubes
l'apayas
Pineapules
Pomegranates
Quinces
saporillas
Soursops
sucrar apples
Loquats
()ther tree fruits

Tung nuts
Walnuts (English or I'ersian)
Almonds
Filberts and hazelnuts
Black walmuts
Cluestmuts
Coconnts
Other nuts
Oranges
Tangerines, mandarins, satsumas (except in selected
States where the proportion
of the crop culled was considerable)
Temple oranges
Valencia oranges (except in selected States where the proportion of the crop culled was considerahle)
Navel oranges (except in selected States where the proportion of the crop culled was considerable)
Otber oranges (except in selected States where the proportion of the crop culled was considerable)
Grapefruit (except in selected States where the proportion of the crop culled was considerable)
Lemons
Limes
Tangeloes
Kumquats
Citrons
Limeduats
Other citrus fruits
Cotton
Popcorn
Sugar bects for sugar
i3roomeorn
Sugarcane for sugar
Tobacco

The quantity sold was estimated for the following crops on the basis of crop-disposition data published by the Agricultural Marketing Service of the U. S. Department of Agriculture:

Alfalfa seed
Red clover secd
Lespedeza seed
Sweetclover seed
Timothy seed
Alsike seed
Soybeans for beans

Cowpeas for dry peas
Peanuts for nuts
Dry field beans
sugarcane and sorghum for sirup
Maple sugar
Maple sirup

In the case of Irish potatoes and sweetpotatoes, the quantity sold was estimated after making allowance for home use, on the basis of data on the disposition of these crops as published by the Agricultural Marketing Service of the U. S. Department of Agriculture.

The quantity sold for the following wiscellaneous crops was estimated on the basis of the reported quantity or value of sales for the 1954 Census or on the basis of the quantity sold as shown for the 1950 Census :

Soybeans for hay
Cowpeas for hay
Peanuts for hay
Velverbeans
Angelica
Anise (excent for oil)
Arnica
Artemisia
13asil
Belladonna
Bloodroot
Borage
Buhach
Burnet
Cascara bark
Carambola
Cassava
Castor beans
Chicory
Chufas
Coriander
Dikon
Dill for oil
Fennel seed
Fejou
Flax for fiber
Foxglove
Ginseng
Gobbe
Golden seal

Guar
Hemp for fiber
Hemp for seed
Jaboticaba
Kudzu crowns
Lemon balm
Litchi nuts
Mint for oll
Olticica nut
Ramie for fiber
Rape seed
Roselle
Safflower
Sesame for oil
Sorrel
Sugar beet seed
Sunflower seed
Sweet corn for seed
Teosinte
Vetiver
Wormseed oil
Lentils
Other grains
Grass silage
Other clover seed
Hubam clover
Mammoth clover
Persian clover
Sour clover
Crotalaria seed

Indigo, hairy seed
Meadow foxtail
Fescue grass
Rhodes grass
The estimated value of all crops sold, except vegetables harvested for sale, nursery and greenhouse products, and forest products, was obtained by multiplying the estimated quantity sold by the State average price. The state average nrices were obtained by the Agricultural Marketing Service of the U. S. Department of Agriculture.

In the case of miscellaneous crops listed above, the average prices have been determined on the basis of reports of quantity sold and value of sales obtained in the 1954 Census of Agriculture.

For the 1950 Ceusus, the value of alt farm products sold was ohtained by inquiry of each farm operator during the enumeration. In that census, inquiries were made regarding the value of farm products sold for a maximmo of 46 individual farm produets or groups of farm products. In most cases, the quantity sold for the individual farm prodnct was obtained together with the value of sales. The total value of farm products sold for 1950 inchodes the value of several farm products not included in the figures for 1904 butter, cheese, skim milk, bees, honey, corn fodder, corn silage, and grain straw, and receipts from the rental of pasture.

Data for the sales of farm products represent total sales for the entire farm, regardless of who shared in the receipts. The landlord's share of crops and llvestock sold and also the livestock
which the landlord took from the tenaut farm to his own place were considered as sales from the tenant farm. Sales of crops grown on a contract basis, of livestock fed on a contract basis, or of poultry raised under a contract with a feed dealer or others, were inchuded as sates from the farm.

The data on sales cover one year's opreration. The sales of crops represent the sales of crops before the enumeration as well as those yet to be sold at the time of the enumeration. Corn, cotton, and other commodities under toan were to be considered as sold at loan prices. Livestock sales are for the calendar year regardless of when the livestock were raised or produced. Most livestock products are sold at the time they are produced. It was assumed that all wool and mohair shorn or clipped in $19 \overline{4} 4$ was sold.

The value of farm products sold does not inchude government payments for soil conservation, lime and fertilizer furnished, and subsidy payments.

When obtaining the value of the farm products sold from farm operitors, the enumerators were instructed to report the gross value without making deductions of any kind. These instructions, however, were not always followed. In the case of milk, pontry, egss, etc., deductions weve often made by buyers of farm products for hauting, handling, marketing, etc., before maklng payments to farmers. In such cases, farm operators often considered the amount of the check received as the gross value of the farm products sold.

## *Available data not couparable.

NA Not available.
${ }^{1}$ For the Census of 1954, in the calendar year; all other censuses, in the calendar year preceding the census.
${ }^{2}$ Total acreage of cropa for which flgures are availeble, except that corn cut for forage wea excluded as most of this acreage was probably duplicated in the acreage of corn harvested for grain.
${ }^{3}$ Total cropland, cropland used only for pasture, and other pasture not fully comparable for the various cerisus years becsuse of differences in definition of cropland used only for pasture. See text.

 follows:

1. When the number of farms or farms reporting is 75 percent of all farms, multiply the percent error by 0.50 .
2. When the number of farms or farms reporting is 90 percent of all farms, multiply the percent error by 0.30 .
3. When the number of farms or farms reporting is 95 percent of all farms, multiply the percent error by 0.20 .

State Table 19.-INDICATED LEVEL OF SAMPLING RELIABILITY OF ESTIMATED COUNTY, ECONOMIC AREA,
AND STATE TOTALS FOR SPECIFIED ITEMS
 is required also to the county, economlc area, or State table in order to thin the number of farms reporting

[^15]State Table 19.-INDICATED LEVEL OF SAMIPLING RELIABILITY OF ESTIMATED COUNTY, ECONOMIC AREA, AND STATE TOTALS FOR SPECIFIED ITEMS-Continued
 is required also to the county, economic area, or State table in order to obtain the number of farms reporting

[^16]
## Chapter B

## STATISTICS FOR COUNTIES

(41)

County Table 1,-FARMS, ACREAGE, VALUE, AND FARM

Economir Area Table 3.-LIVESTOCK ON HAND, LIVESTOCK SOLD, AND SPECIFIED
[Data are based on reporta for anly

${ }^{1}$ For comparablifty of data on Livestock and poultry, see text and State Table 12.
${ }^{2}$ Includes milk equivalent of crean and butterfat sold.
${ }^{3}$ Excludes grass eilage.

## OHIO

CROPS. BY ECONOMIC CLASS OF FARM: CENSUSES OF 1954 AND 1950-Continued

Economic Area Table 6.-LIVESTOCK ON HAND, LIVESTOCK SOLD, AND

For comparability of dala on livestock and poultry, see text and State Table 12 .
${ }^{2}$ Includes milk equivalent of crean and butterint sold.
${ }^{3}$ Excludes grass silage.

SPECIFIED CROPS, BY TYPE OF FARM: CENSUSES OF 1954 AND 1950
a sample of farms. See text]
